PLC Programming II

April 15, 2026

Check In 1 / 2

The progress on my midterm project is going quite well. At this point, I have the Pylogix data collection script fully integrated with the Django Web Server. This means that events are automatically logged and are searchable through a web interface. The biggest hurdle that I had was figuring out how to get the Pylogix script working in its own thread upon server startup, but that has been resolved without much issue. Due to my current class load including Databases, where I use Django, I have had no problems with getting that up and running. The features that I still need to add are a statistics page, a trending of some sort, as per the requirements, and I would also like to integrate the heartbeat so that the PLC can know when the safety logging server is not running. Getting the rest of those features complete should be easy enough in the next couple of weeks, and I do not foresee any issues with it. In fact, I have already begun working on the statistics page, and am about halfway done with that. It should not be too much work to wrap up the project in the allotted amount of time.
